PPS

Polypropylene Spun Filters

10" or 20" (1um, 5um or 20um)

Removes particles such as sediment sand, silt, dirt, dust and rust.

Made of tightly spun fibre.

This should be the first filter in your system for water. With lots of particles in it, you may want more than one of these filters in your system. For example, 20 micron first, 5 micron second, the higher the micron, the more particles the filter will let through.

Pleated spun filters cannot be washed.

This should be replaced yearly, or if there is a noticeable pressure drop, then earlier.

PPL

Polypropylene Pleated Filters

10" or 20" (1um, 5um or 20um)

Removes particles such as sediment sand, silt, dirt, dust and rust.

Made of cellulose and polyester media, pleated around a polypropylene core for strength.

This should be the first filter in your system; for water. With lots of particles in it, you may want more than one of these filters in your system. For example, 20 micron first, 5 micron second, the higher the micron, the more particles the filter will let through.

Pleated filters have more surface area than poly spun filters, so will take longer to block up. Poly pleated filters can also be washed.

This should be washed or replaced yearly, or if there is a noticeable pressure drop, then earlier. Washing will reduce the effectiveness over time.

CTO

Chlorine, Taste & Odour Filters

10" or 20" (1um or 5um)

Removes odour, chemicals including chlorine and helps improves taste and colour.

Made of high-quality activated carbon (Carbon Block)

This filter should come after the sediment removal filter and is recommended for household drinking water (If you are going to use just one filter to improve overall taste for drinking, we recommend this one).

This should be replaced every 6 to 12 months, or if there is a noticeable pressure drop and you have replaced the sediment filters, then earlier.

GAC

Granular Activated Carbon Filters

20" (1um or 5um)

Removes chlorine, chemicals, tastes and odours from water.

Made of high-quality coconut shell carbon and granular activated carbon.

This filter should come after the sediment removal filter and CTO filter and is often used for improving the aesthetic impurities in the water (colour, taste and odours)

This should be replaced every 6 to 12 months, or if there is a noticeable pressure drop and you have replaced the sediment filters, then earlier.

KDF + GAC

Kinetic Degradation Fluxion + Granular Activated Carbon Filters

10" or 20" (5um)

Removes hydrogen sulphide, iron, lead, nickel, chromium, cadmium, calcium, aluminium, mercury, arsenic, and other organic compounds.

KDF kills algae and fungi; effectively controlling bacteria growth, pesticides, organic matter and rust.

GAC removes chlorine, chemicals, tastes and odours from water.

This filter should come after the sediment removal and CTO filter.

This should be replaced every 6 to 12 months, or if there is a noticeable pressure drop and you have replaced the sediment filters, then earlier.

ION

ION Exchange Cationic Resin Filters

10" or 20" (5um)

Removes calcium & lime scale.

ION Resin - ION Exchange Cationic Resin Filters are made of high-quality coconut shell with high adsorption capacity.

ION exchange water softeners use resin beads to attract and remove calcium and magnesium ions from the water, replacing them with sodium ions. This process reduces water hardness, softening water and prevents scale build up, staining, calcium build ups and increases the effectiveness of detergents.

Extends the life of plumbing fittings and appliances by reducing scale build up.

Extremely effective at removing calcium and lime scale.

This filter should come after sediment filter and before CTO filter.
